

the 1990s, the number of people in the world who are under 15 years of age is expected to increase from 1.2 billion to 1.5 billion.

As the world's population grows, the demand for food and other resources will increase. This will put pressure on the environment and on the world's food supply. It is important that we find ways to meet this demand without harming the environment or the world's food supply.

One way to do this is to use sustainable agriculture. Sustainable agriculture is a way of farming that uses natural resources in a way that does not harm the environment. It uses techniques such as crop rotation and natural pest control.

Another way to do this is to use sustainable forestry. Sustainable forestry is a way of managing forests that does not harm the environment. It uses techniques such as selective logging and reforestation.

Finally, we can use sustainable fishing. Sustainable fishing is a way of managing fisheries that does not harm the environment. It uses techniques such as catch limits and marine reserves.

By using sustainable agriculture, sustainable forestry, and sustainable fishing, we can meet the world's demand for food and other resources without harming the environment or the world's food supply.

It is important that we all work together to make sure that we are using resources in a sustainable way. This will help to ensure that we have enough food and other resources for the future.

There are many ways that we can help to make sure that we are using resources in a sustainable way. We can all play a part in this.

For example, we can eat less meat, which will help to reduce the demand for food. We can also use less water, which will help to conserve this important resource.

Finally, we can all do our part to protect the environment. This will help to ensure that we have a healthy planet for the future.

By working together, we can make sure that we are using resources in a sustainable way. This will help to ensure that we have enough food and other resources for the future.
