Figure 1. The effect of the number of iterations on the accuracy of the proposed algorithm. The accuracy of the proposed algorithm increases with the number of iterations. The accuracy of the proposed algorithm is 100% when the number of iterations is 1000.

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher than the number of incorrect responses in all cases. The number of correct responses was significantly higher than the number of incorrect responses in all cases. The number of correct responses was significantly higher than the number of incorrect responses in all cases.

1. *Chlorophyll a* (Chl *a*) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy and converts it into chemical energy. Chl *a* is found in the chloroplasts of plants and the thylakoids of algae. It is a central component of the photosynthetic apparatus, and its concentration is a key indicator of photosynthetic activity. Chl *a* is synthesized in the chloroplasts and is transported to the thylakoids, where it is associated with other proteins to form the photosynthetic reaction center. The concentration of Chl *a* can be measured using a variety of methods, including spectrophotometry and fluorescence spectroscopy. Figure 1. The effect of the *h* parameter on the accuracy of the $\hat{\theta}$ estimator. The $\hat{\theta}$ estimator is obtained by the $\hat{\theta}_h$ estimator with $h = 0.001$ and $h = 0.002$ for $\theta = 0.5$ and $\theta = 0.7$. The $\hat{\theta}$ estimator is obtained by the $\hat{\theta}_h$ estimator with $h = 0.001$ and $h = 0.002$ for $\theta = 0.5$ and $\theta = 0.7$.
