

the 1990s, the number of people in the world who are undernourished has increased from 600 million to 800 million, and the number of people who are malnourished has increased from 1.2 billion to 1.5 billion.

There are many reasons for this increase. One of the main reasons is that the world population has increased from 5 billion in 1989 to 6 billion in 1999. This increase in population has led to a corresponding increase in the demand for food. Another reason is that the world's food production has not kept pace with the increase in demand. This is due to a number of factors, including a decline in the area of land available for agriculture, a decline in the productivity of agriculture, and a decline in the amount of food that is available for consumption.

There are also a number of other factors that contribute to the increase in malnutrition. These include a decline in the quality of food, a decline in the availability of food, and a decline in the ability of people to afford food.

The increase in malnutrition is a serious problem that needs to be addressed. There are a number of ways in which this problem can be addressed, including increasing food production, improving the quality of food, and increasing the availability of food.

One of the most important ways to address the problem of malnutrition is to increase food production. This can be done by increasing the area of land available for agriculture, by increasing the productivity of agriculture, and by increasing the amount of food that is available for consumption.

Another important way to address the problem of malnutrition is to improve the quality of food. This can be done by increasing the amount of food that is available for consumption, by increasing the variety of food, and by increasing the nutritional value of food.

A third important way to address the problem of malnutrition is to increase the availability of food. This can be done by increasing the amount of food that is available for consumption, by increasing the variety of food, and by increasing the nutritional value of food.

There are a number of other ways to address the problem of malnutrition, including increasing the ability of people to afford food, increasing the awareness of the problem, and increasing the support for food production.

The problem of malnutrition is a complex one that requires a multi-faceted approach. By increasing food production, improving the quality of food, and increasing the availability of food, we can help to reduce the number of people who are malnourished.

There are a number of other factors that contribute to the problem of malnutrition, including a decline in the area of land available for agriculture, a decline in the productivity of agriculture, and a decline in the amount of food that is available for consumption.

There are a number of other factors that contribute to the problem of malnutrition, including a decline in the area of land available for agriculture, a decline in the productivity of agriculture, and a decline in the amount of food that is available for consumption.
