

the 1990s, the number of people in the world who are undernourished has increased from 600 million to 800 million.

There are a number of reasons for this. One is that the world's population has increased by 1.5 billion in the last 20 years. Another is that the world's population is becoming more urban. And a third is that the world's population is becoming more affluent. As a result, the demand for food has increased, and the world's food supply has not kept pace.

There are a number of ways to address this problem. One is to increase the world's food supply. This can be done by increasing the world's agricultural production. Another way is to reduce the world's food waste. And a third way is to improve the world's food distribution system.

There are a number of challenges to addressing this problem. One is that the world's food supply is not evenly distributed. Another challenge is that the world's food supply is not sustainable. And a third challenge is that the world's food supply is not affordable.

There are a number of ways to address these challenges. One is to increase the world's food supply. Another way is to reduce the world's food waste. And a third way is to improve the world's food distribution system.
